HTML and CSS validation

HTML validation only showed the errors on form action – something that was intentionally set as this is a dummy form and not meant to gather data.

CSS validator found no errors.

W3C CSS Validator results for TextArea (CSS level 3 + SVG)

Congratulations! No Error Found.

This document validates as **CSS level 3 + SVG** !

To show your readers that you've taken the care to create an interoperable Web page, you m

keyboard-only completion and submission attempt

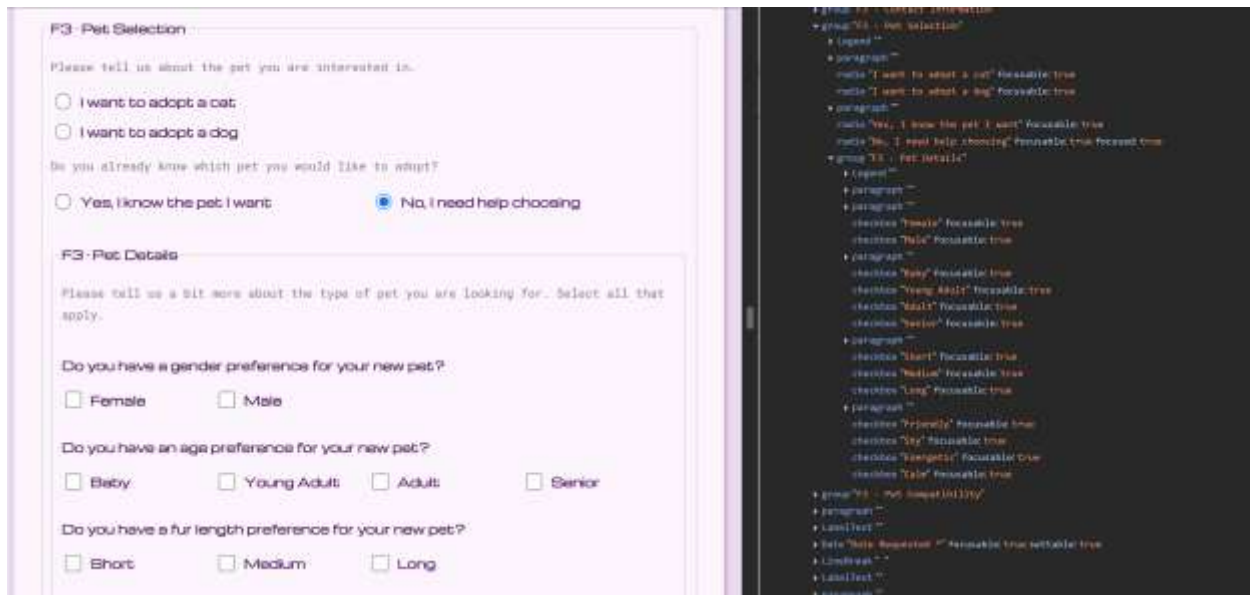

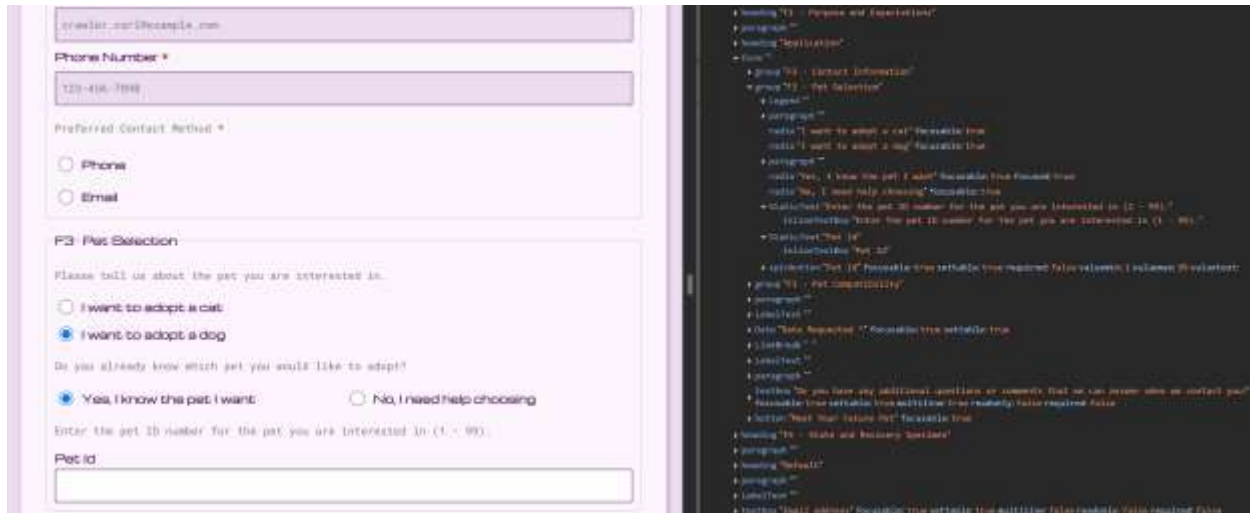

All fields were accessible with the keyboard. I had to look up how to switch toggles in a radio button (left or right arrow) and how to toggle on or off a checkbox (spacebar).

accessible-name/group inspection for representative text, radio, checkbox, select, and textarea controls

All form fields have accessibility labels. The 'hidden' items that only show when specific radio buttons are selected also show/hide in the accessibility tree. Changing the initial answer does not seem to untoggled the other options from the tree once they have been 'seen' however.

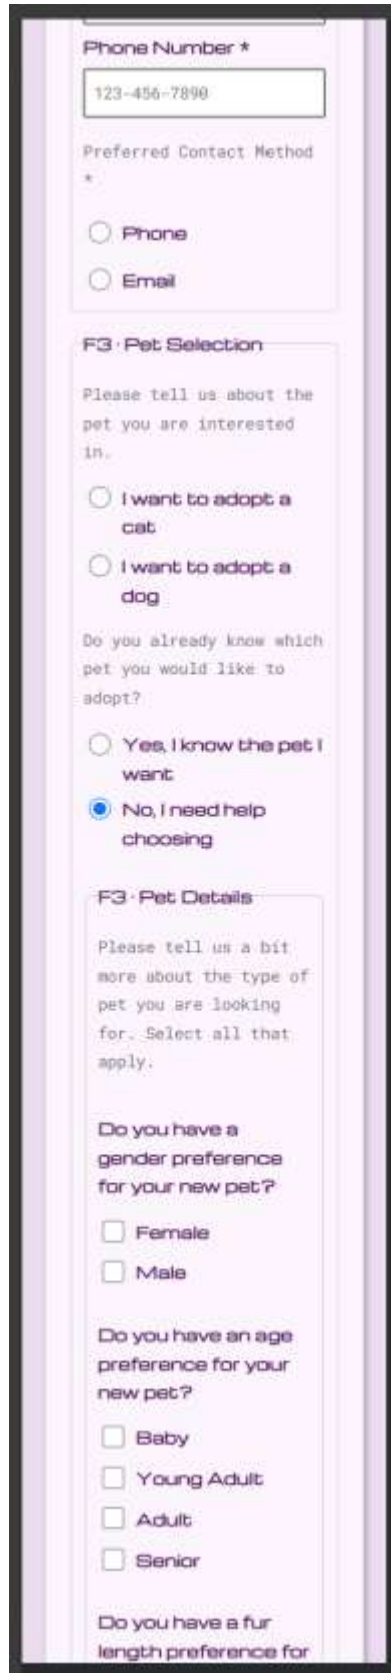

empty, malformed, boundary-minimum, boundary-maximum, and valid submissions

When applicable, type formatting was applied. Additional restrictions were limited (keeping pet id between 1-99, enforcing a 10 digit phone number). Ideally any more stringent checks would be handled with javascript (email filtering in particular).

Preferred Contact Method *

☐ Phone

☐ Email

F3 · Pet Selection

Please tell us about the pet you are interested in.

☐ I want to adopt a cat

☐ I want to adopt a dog

Do you already know which pet you would like to adopt?

☐ Yes, I know the pet I want

☒ No, I need help choosing

F3 · Pet Details

Please tell us a bit more about the type of pet you are looking for. Select all that apply.

Do you have a gender preference for your new pet?

☐ Female ☐ Male

Do you have an age preference for your new pet?

☐ Baby ☐ Young Adult ☐ Adult ☐ Senior

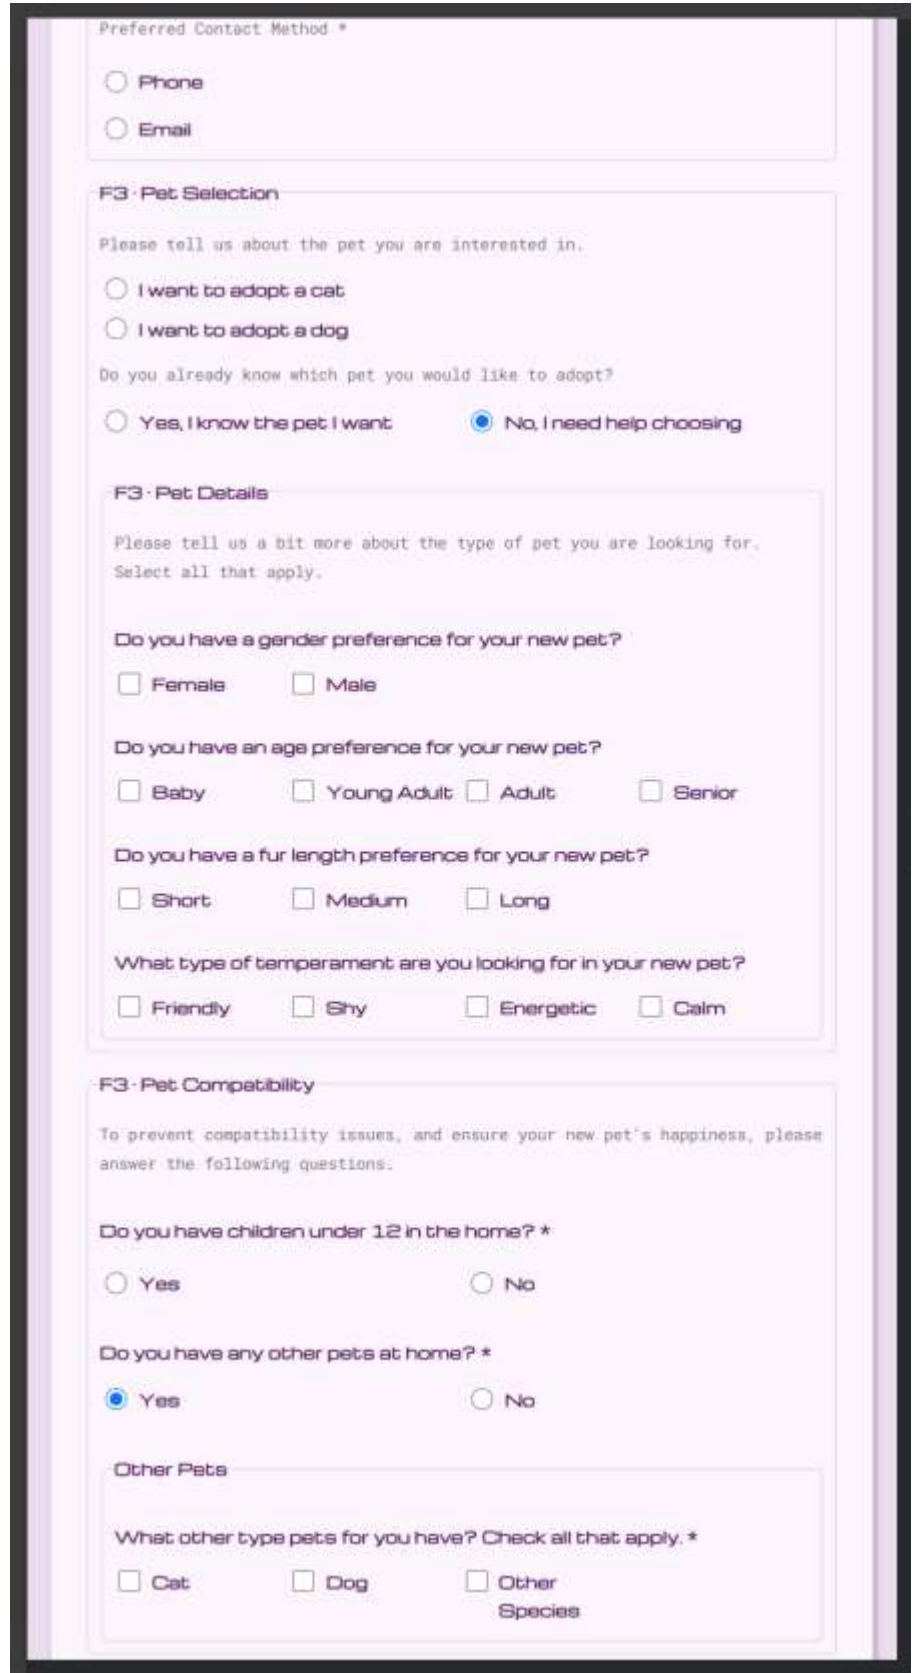

Do you have a fur length preference for your new pet?

☐ Short ☐ Medium ☐ Long

What type of temperament are you looking for in your new pet?

☐ Friendly ☐ Shy ☐ Energetic ☐ Calm

200% zoom/reflow

The screenshot shows a web form for pet adoption. At the top, there are two radio button options: "I want to adopt a cat" and "I want to adopt a dog". Below these is the question "Do you already know which pet you would like to adopt?". There are two radio button options for this question: "Yes, I know the pet I want" and "No, I need help choosing", with the latter being selected. Below this is a section titled "F3 · Pet Details" with a subtitle "Please tell us a bit more about the type of pet you are looking for. Select all that apply." followed by a list of checkboxes for pet types. Below that is the question "Do you have a gender preference for your new pet?" with two checkboxes: "Female" and "Male".

focus visibility and comfortable pointer/touch operation

Focus uses a complementary color (gold) from the main color palette (purple), to ensure it stands out and is easily visible. Care was paid to the layout of toggles, especially on smaller screen sizes, but utilizing a strict grid system that ensured selections were easy to make.

query-string inspection with fictional data if the instructor authorizes temporary method="get"

It is too long for a screenshot, but here is the relevant part:

Interactive form fields

I wanted to mimic javascript's ability to make an interactive form that presents different questions based on previous choices. I knew I could use `display:none` to hide the additional questions and `display:block` to unhide them. I built my form so that the hidden sections could be targeted by class (I chose class as initially I planned to have each part separate – then decided it would be cleaner to pop them into a fieldset instead) to unhide them when the appropriate radio button was selected. It took me a bit before I figured out I needed to pull the radio button out of the label for the toggle to work (they needed to be siblings). I also wanted the ability to re-hide them, if the radio toggle was changed. I did this by using `:not(:checked)`. It worked wonderfully for my first radio button, as yes toggled one set of questions and no toggled the other. For my second radio button I struggled, as neither yes or no was having any affect on the form. After re-examining my HTML I looked to my CSS, where I found the culprit: bad logic! Yes was set to toggle the section on, but the `no:not(:checked)` was set to toggle it off. This double negative effectively said yes turns it on and yes turns it off, which meant it stayed off. Swapping the off to just `no:checked` solved the issue and gave me the interactive form I was looking for!
